

Network License Update Instructions

To install the Update for any of the Bradley Software Product on a network version, the installation sequence is very similar to the standalone version.

Installation Steps:

- 1) Download the most recent service pack from our website <http://www.bradleysoftware.com/> look for the Support tab and UPDATES. Save the update installer on your network somewhere you can get to easily. Typically, this is the shared drive where the Bradley programs reside.
- 2) VERY IMPORTANT: Make sure no-one is using the program EXE. If they are, have them close the program or the update will not run properly, and you will have problems.
- 3) Log on to any client PC that already has the prior year's Software product network Client installed. Make sure that you have full access to write/delete files to the network directory where the executable files are located.
- 4) Download the patch file downloaded and saved in step 1 and double click on it.
- 5) The installation will run and locate the network directory from settings that were saved during the original installation of the network client.
- 6) The files will be installed to the network directory and to the local PC.
- 7) Done!

If you have questions or need assistance contact support [here](#) or send an email to techsupport@bradleysoftware.com.

Note: You will be notified if you are required to go to each installed machine and run the update separately. Otherwise, the network update only requires you to run it one time on one machine.
